More information This plugin works by analysing the keycodes and generates an AutoCAD command string that performs the action. You can set a key to perform a specific action. For example you can create a key to move an object to the front face of an object. If you want to use multiple different objects you can also assign a key to a multiple different objects that you want to be the same key. There are multiple object types that can be assigned to a key. The default objects are the layer objects. The layer objects are used to separate all the objects on a sheet of paper or any printable object. The objects on the sheet of paper are saved and can be used to generate a printable object if you need to re-print the sheet of paper. By assigning a layer object to a key you can easily separate the objects on a sheet of paper. The sequence object is used to move an object in a specific order. The order can be chosen as a subsequence, sequence, or a pause between the action and the object. The step object is used to move an object. There are various options that can be used. The options can be defined as a positive or negative number of steps or a number of milliseconds to perform the step. The command object is used to perform a command that cannot be performed with the regular objects. For example, you can assign a command to a key that moves an object to the inside of a box. The command options are as follows: COMMAND OPTIONS Number of steps: a number of steps to move the object to the inside of the box Number of milliseconds: a number of milliseconds to move the object to the inside of the box OVERLAY Option: True or
