A laboratory technique for use in the early diagnosis of human prostatitis. The presence of gram-negative bacilli in urogenital infections may be responsible for the development of prostatitis. In order to develop a more specific and sensitive technique for the early diagnosis of this condition, a laboratory test was devised which allowed rapid presumptive identification of gram-negative bacilli in clinical specimens. The method used a loopful of a urine specimen and streaked onto a selection of 5% sheep blood agar plates supplemented with a specific antibiotic combination (nalidixic acid, cephradine and cefotaxime). The streaked plates were incubated aerobically in a selective broth for 24 hours at 37 degrees C and then incubated anaerobically in blood agar media for a further 24 hours at 37 degrees C. The plates
