max payne 3 is the first game in the franchise to support the rockstar advanced game engine (rage) as its game engine, allowing developers the ability to make use of all the features that the game engine has to offer. this game uses the third person-style approach to shooting, which allows the player to aim with the analog stick, providing a broader range of aiming options than in previous games. the game includes a brand new weapon animation system which allows for a wider range of animations, giving each weapon its own unique spin and feel. in max payne 3, the player can now choose to move and shoot in slow motion during the execution of devastating moves, with even more options being available with the new shootdodge mechanic. the player also has the option of activating the final kill-cam feature, which allows the player to capture the moment where a player successfully kills an enemy for the first time in a game. the game also includes a new aiming system called "natural motions euphoria" which allows players to aim in the game with the analog stick, and aim with their mouse as well. max payne 3 delivers an immersive, fast-paced and atmospheric single-player campaign that allows the player to explore a vast new world, with the game now being set in new york city, and featuring a new protagonist. payne will be responsible for growing the cps service and rental department through supporting contractors by servicing equipment repairs including, but not limited to, all brand types of floor grinding and polishing equipment, shot blasters, generators and much more. he also has an extensive knowledge of diamond tooling and polishing techniques. we are extremely excited to have corey payne on board at cps. his ability to fix any and everything helps cps be able to service all contractors whether they have cps equipment or not!, says dustin thomas, marketing and inside sales manager.

in particular, if the elasticity of the filler phase and the modulus of the matrix phase are so different that the filler does not contribute to the matrix's e-modulus, then the payne effect will be positive or negative depending on how the strain is divided between the two phases (yang et al., 2008). the payne effect is seen in composites containing fibers such as carbon fiber or glass fiber. for example, at low strain, the e-modulus will be higher because of the high fiber content (i.e., small fiber diameter), whereas at higher strain, the payne effect will reverse, and a lower e-modulus will be observed. this is illustrated in fig. 14.5. figures 14.6 and 14.7 demonstrate the payne effect in composites containing metal particles. the payne effect is seen in such hard-filled materials as lead-carbon composites, in which the hardness of carbon fillers has been greatly increased by their high content. the payne effect is also seen in high-stress-bearing materials, such as epoxy, composites containing glass fibers, and a wider range of high-strength composites, such as carbon fiber, glass fiber, ceramic fiber, etc. too much payne effect will result in hard brittle failure, and thus limit the practical use of such materials (chen et al. following the payne effect, an increase in fracture energy is observed with the addition of carbon nanotubes due to the presence of smooth carbon surfaces in the matrix, resulting in increased toughness. due to the presence of such smooth surfaces, carbon nanotubes can transmit stress directly into the matrix and decrease the risk of chipping. additionally, the strong fiber-matrix interface due to the smooth carbon surface causes a large number of secondary events, i., crack propagation and fracture, to be concentrated near the interface. this results in a very large area of mixed mode, producing a large e-modulus in the vicinity of the interface (li et al., 2004; patil et al., 2005; singh et al., 2005; sun et al., 2006; li et al., 2007). when compression is applied, filler particles will align to be close to the surface, as a result of the reduced friction between the filler and matrix. the interfacial interlocking mechanism will provide a force that resists fracture, resulting in a higher e-modulus (hilferty et al. the relatively simple viscoelastic properties of carbon nanotubes make them ideal fillers. figure 14.8 shows the stress-strain diagram of a polymer filled with carbon nanotubes. the viscoelastic behavior of carbon nanotubes suggests that they are capable of filling the gap between the filler and the matrix effectively. carbon nanotubes have also been shown to increase the strain at break for a polystyrene (li et al., 2005).
